

A useful loop should improve by passing through itself

$$M = \langle X, O, S, E, A, C \rangle \quad \hookrightarrow \quad M^{up}(M) \rightarrow M'$$

X

State / Object

O

Operation

S

Selection

E

Evaluation

A

Abstraction

C

Reintegration

Hierarchical Lift: $T(M) = M^{up}(M)$ · Typed Composition: $M(x) = C(A(E(o_S(x), e_X(x))))$

Separate recursion from real improvement

LANE 01

Baseline

Raw procedure before any revision. Frozen benchmark.

No Revision

LANE 02

Generic Revision

Clarity and rigor edit without self-application instruction.

Control Δ_{generic}

TARGET 03

Self-Application

Method inspects and transforms its own selector, evaluator, and rules.

$\Delta_{\text{self}} - \Delta_{\text{generic}} > 0$

LANE 04

Decorative Loop

Explicit self-referential prose without functional procedure edits.

Null Control (~ 0)
